

HANDS-ON WORKSHOP

Using generative AI, responsibly

Prompt well · verify always · protect confidentiality · keep humans in the loop.

Facilitated by Alex Donnelly · AI Adoption Specialist (sample)

Independent work sample for this application. Not affiliated with or endorsed by Winston Taylor. Use only approved tools; never enter client or privileged data into unapproved tools.

Three ground rules

- This is hands-on — we'll work real (non-confidential) examples together.
- Confidentiality holds the whole time: no client or privileged data in unapproved tools.
- AI is a first draft, never the final word — an attorney reviews and owns every output.

WHAT YOU'LL LEAVE WITH

Four habits that make AI safe and useful

1

Prompt well

Clear asks, the right context, and iterating toward a usable draft.

2

Verify always

Catch hallucinations; check every citation exists and supports the point.

3

Protect confidentiality

Know what data goes where; approved tools only.

4

Human in the loop

An attorney reviews and owns the output; escalate when unsure.

MODULE 1

Prompting for legal work

Get a better first draft, faster.

- Give the model a clear role, task, and the context it needs.
- Be specific about format, audience, and constraints.
- Iterate — refine the prompt instead of accepting the first answer.
- Keep the input non-confidential unless you're in an approved, firm-contained tool.

MODULE 2

Verifying outputs

Trust nothing you haven't checked.

- Treat every fact and citation as unverified until you confirm it.
- Open the source — does the cited authority exist and say what's claimed?
- Watch for confident-sounding but wrong details (hallucinations).
- If it can't be verified, it doesn't go in the work product.

MODULE 3

Protecting confidentiality

The line you never cross.

- Know your data classification: what may be used with which tool.
- Client and privileged data stays in approved, firm-contained tools only.
- When unsure, treat it as confidential and ask before you act.
- A quick point-of-use check beats an after-the-fact incident.

MODULE 4

Human-in-the-loop & escalation

You stay accountable.

- An attorney reviews and owns every AI-assisted output.
- AI supports judgment — it never replaces it.
- Know the escalation route for questions, suspected errors, or misuse.
- Flag issues early; that's how the whole firm gets safer.

HANDS-ON

Practice drill: prompt → verify

1. Take a provided, non-confidential document and ask the tool for a structured summary.
2. Refine your prompt once to improve the result.
3. Pick three facts and verify each against the source document.
4. Find one thing the tool got wrong or couldn't support — and note how you caught it.

Where it helps — and where it doesn't belong

USE IT FOR

DON'T

Summarize long internal documents (with review)

Paste client/privileged data into an unapproved tool

First-draft memos & outlines (verify every cite)

Rely on AI citations without checking them

Draft routine correspondence & templates

Send AI output to a client without attorney review

Brainstorm arguments & issue-spot

Treat AI analysis as legal advice or final work

Leaving with what you need

1

Starter use cases

Two safe, high-value tasks to try this week.

2

Guardrail one-pager

Confidentiality, data classification, verify & cite, escalate.

3

Office hours

Weekly drop-in help while the habit forms.

4

Champions

Peers who model safe success and share what works.

Fast, and safe.

That's the goal — more time for judgment and advocacy, with the firm and its clients protected.
